1.0 PROJECT DESCRIPTION

1.1 PRINCIPLES OF PAVEMENT MANAGEMENT

Nationwide, billions of dollars have been invested in roadway networks by municipal, state and federal governments. Locally, the ten agencies that make up the Coachella Valley Association of Governments (CVAG) have over 346 miles of streets that make up their inter-agency arterial roadway network. At a replacement cost exceeding \$1,500,000 dollars per mile – not including the value of the land, the CVAG agencies have over \$527 million invested in their arterial roadway network as shown in the following chart (the total mileage exceeds 346 as numerous street segments have joint ownership).

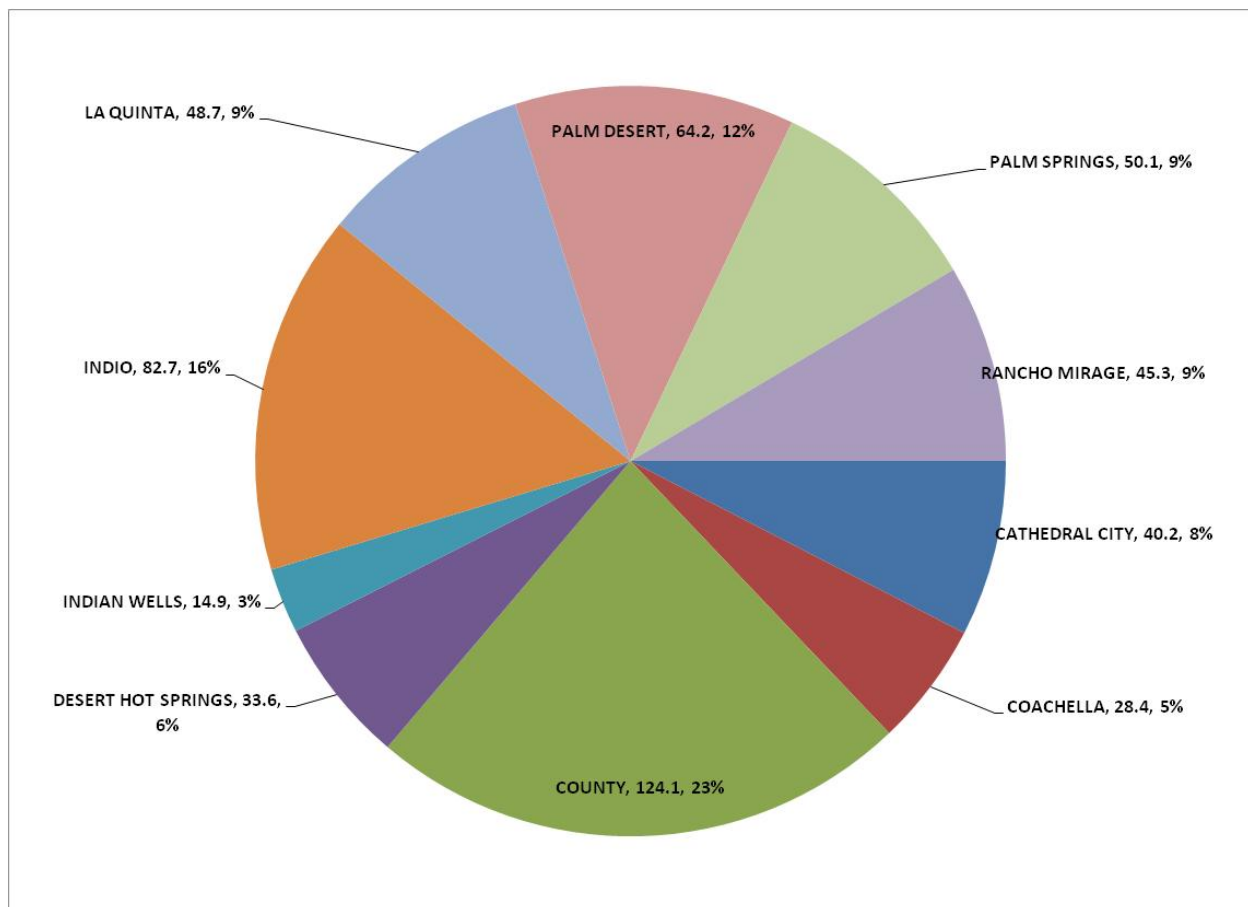

Figure 1 – Replacement Value of the CVAG Paved Roadway Network (\$M, %)
Total = \$527M

Preservation of existing road and street systems has become a major activity for all levels of government. There is a shortage of funds to maintain street systems at the state and local government levels. Funds that have been designated for pavements must therefore be used as effectively as possible. One proven method to obtain maximum value of available funds is through the use of a pavement management system.

Pavement management is the process of planning, budgeting, funding, designing, constructing, monitoring, evaluating, maintaining, and rehabilitating the pavement network to provide maximum benefits for available funds. A pavement management system is a set of tools or methods that assists decision makers in finding optimum strategies for providing and maintaining pavements in a serviceable condition over a given time period.

As shown in Figure 2, streets that are repaired when they are in a good condition will cost less over their lifetime than streets that are allowed to deteriorate to a poor condition. Without an adequate routine pavement maintenance program, streets require more frequent reconstruction, thereby costing millions of extra dollars.

As can be seen in Figure 2, over time pavement quality drops until the pavement condition becomes unacceptable. For each street, the shape of the curve, and hence rate of deterioration, is dependent on many factors – foremost of which are the strength of the roadway structure and traffic loading. The key to a successful pavement management program is to develop a reasonably accurate performance model of the roadway, and then identify the optimal timing and rehabilitation strategy. The resultant benefit of this exercise is realized by the long term cost savings and increase in pavement quality over time. As illustrated in Figure 2, pavements typically deteriorate rapidly once they hit a specific threshold. A \$1 investment after 40% lifespan is much more effective than deferring maintenance until heavier overlays or reconstruction is required just a few years later.

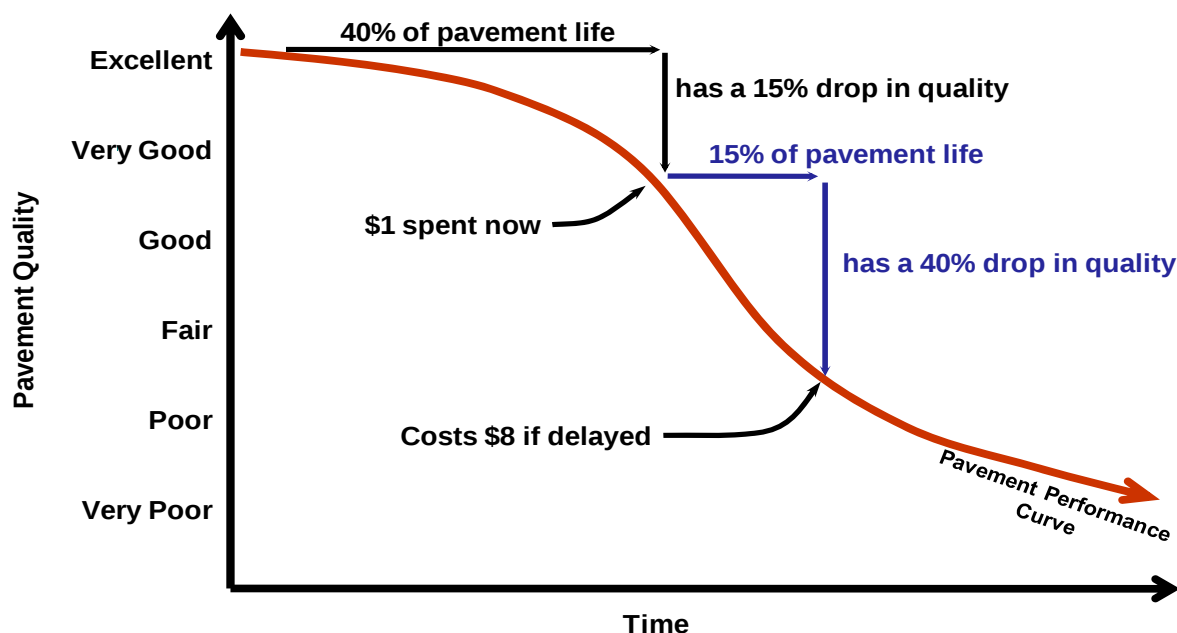

Figure 2 – Pavement Deterioration and Life Cycle Costs

Once implemented, an effective pavement information management system can assist agencies in developing long-term rehabilitation programs and budgets. The key is to develop policies and practices that delay the inevitable total reconstruction for as long as practical yet still remain within the target zone for cost effective rehabilitation.

That is, as each roadway approaches the steep part of its deterioration curve, apply a remedy that extends the pavement life - at a minimum cost, thereby avoiding costly heavy overlays and reconstruction. Thus, the goal of a pavement information management system is to identify the optimal level of funding, timing, and renewal strategy agencies should adopt to keep their roadway network at a satisfactory level of service. Figure 3 illustrates the concept of extending pavement life through the application of timely rehabilitation activities.

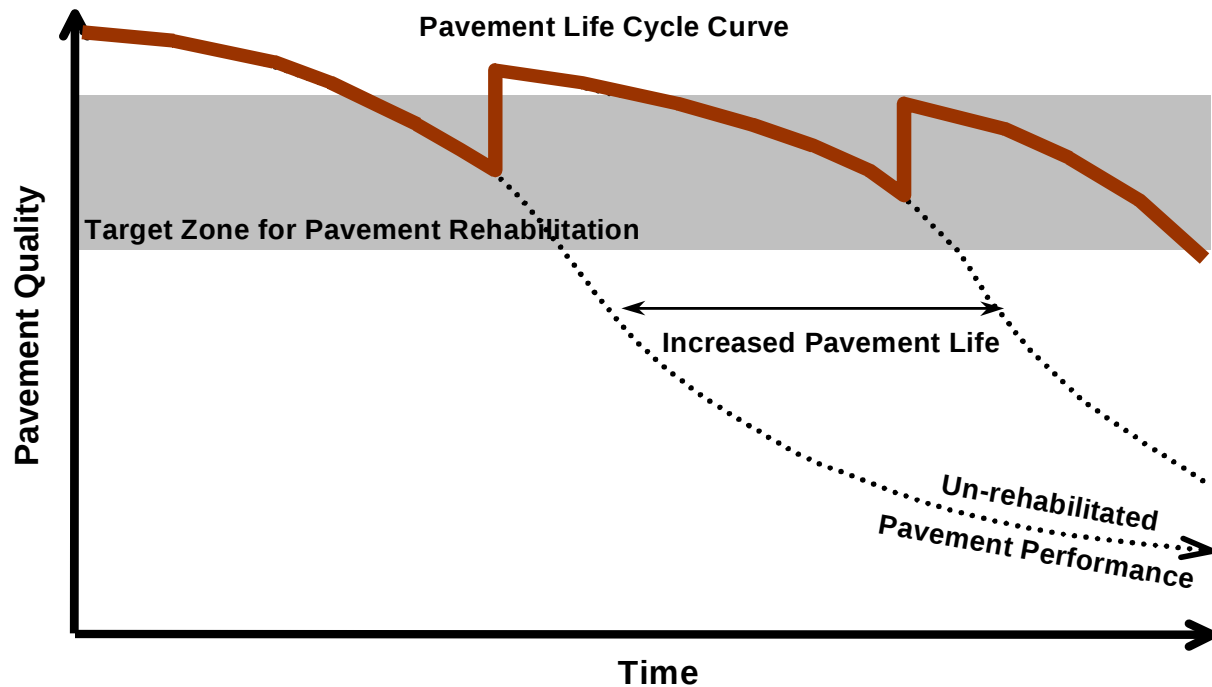

Figure 3 – Pavement Life Cycle Curve

Ideally, the lower limit of the target zone shown in figure 3 would have a minimum value of 65 to 75 – that is to keep as many streets as possible requiring a thin overlay or less. The upper limit would tend to fall close to upper range of the good category – that is a pavement condition score of 85.

Other functions of a pavement management system include assessing effectiveness of maintenance activities and new technologies; storing historical data and images; and providing a central point of access for as-built records, easements and agreements, and right of way assets.

1.2 PAVEMENT MANAGEMENT SOFTWARE AND DATA COLLECTION

The software requested by CVAG for the analysis and reporting was MicroPaver. MicroPaver uses surface distress based observations to establish a 0 to 100 pavement condition index (PCI). The program assumes all pavements start with a perfect score of 100 and then makes a series of deducts based on the number, quantity and severity of surface distresses. Within the PCI calculator, not all distresses are assigned equal weighting. For example, small wheel path rutting and alligator cracking have a more significant impact on the PCI score than bleeding or raveling, even at much higher levels.

The CVAG roadways were surveyed using a specialized vehicle designed to simultaneously collect roughness, extent – severity based distress observations, GPS coordinate information and digital images. The arterial network was divided into logical segments from major intersection to major intersection, with each segment having a ½ mile upset limit.

All segments were surveyed from end to end, with wider roadways receiving two passes to ensure complete coverage of the pavements. Within the inventory, terms similar to “DS@2640E Monroe St” are used. This should be read as “Distant split 2640 feet east of Monroe St”. This was used to accommodate the ½ mile upset limit where no cross streets were apparent.

Streets with joint jurisdiction were entered into the database twice (sometimes three times) with the appropriate length and width assigned to each agency – however the pavement condition score was set to equal the whole section. The section ID assigned to each segment is a combination of the map ID assigned to each segment and an agency number as follows:

Cathedral City	001
Coachella	002
County	003
Desert Hot Springs	004
Indian Wells	005
Indio	006
La Quinta	007
Palm Desert	008
Palm Springs	009
Rancho Mirage	010

The 3 most right digits are the agency code, and the remaining digits to the left are the map ID. Thus section 291010 is Map ID 291 and is located in 010 – Rancho Mirage. This methodology allows a single map ID to have multiple sections within it to reflect the joint ownership.

Pavement condition observations were collected following the ASTM D6433 protocols using the following distresses:

Wheel path rutting, longitudinal and transverse cracking, alligator cracking, block (map) cracking, edge cracking, distortions (bumps and sags, corrugations, depressions, shoving and swell), bleeding, raveling, patching and potholes.

Pavement age was estimated by back calculating the time to the last score of PCI = 100 using a single performance curve. Street segments that have joint ownership were surveyed as a single entity but entered into the database twice with the length or width adjusted according to ownership.

1.3 UNDERSTANDING THE PAVEMENT CONDITION SCORE

The following table compares the ASTM D6433 based Pavement Condition Index (PCI) score used in the CVAG survey and analysis (MicroPaver) to commonly used descriptive terms. The table also provides description of common rehabilitation activities within each range as well as the approximate remaining life of the pavement.

PCI	Condition Description	Possible Rehab Activities	Potential Remaining Life
100	Excellent	Routine Maintain Activities	15 to 25 Years
95			
90			
85	Very Good	Seal Coats, Slurries, Chip Seals, Microsurfacing	12 to 20 Years
80			
75			
70	Good	Thin Overlays, Possibly With Localized Repairs and Edge Grinding	10 to 15 years
65			
60			
55	Fair	Progressively Thicker Overlays, Possible Full With Grinding and Base Rrepairs	7 to 10 Years
50			
45			
40	Moderate	Partial to Full Reconstruction, Possibly With Base Stabilization	0 to 10 Years
35			
30			
25	Poor		
20			
15			
10	Very Poor		
5			
0			

It should be noted that the relative remaining pavement life presented in the table above is not the same as pavement age. Remaining pavement life is the timeframe expressed in years, in which a street section will provide acceptable levels of service before a rehabilitation needs to be applied under optimal funding and operating conditions. The relative remaining life can certainly be exceeded with no rehabilitation or maintenance and the pavement allowed to continue to deteriorate until it eventually returns to gravel or is unserviceable. The remaining life may also be extended by effective maintenance activities.

The above table using generic terms such as thin, thick or extensive to quantify the pavement rehabilitations. This terminology was used specifically for illustration purposes only as the selected rehabilitations vary between pavement types and functional classification. The actual thickness and type of rehabilitation are defined in Section 3 of this report.

2.0 ROADWAY NETWORK CONDITION AND FINDINGS

2.1 ROADWAY NETWORK SIZE

The CVAG paved arterial roadway network consists of a single functional class covering approximately 346.7 centerline miles of pavement. The average overall pavement condition of the roadway network at the time of survey was 56 with a wide spread of condition within the network. The following table summarizes the network by agency.

Agency	Agency Length (ft)	Agency Length (mi)	Apportioned Centerline (ft)	Centerline Miles (mi)	%	Agency Area (Yd2)	Pavement Condition Index (PCI)	Maximum PCI	Minimum PCI
CATHEDRAL CITY	142,098	26.9	123,145	23.3	7	772,216	41	89	0
COACHELLA	124,089	23.5	105,193	19.9	6	510,218	41	90	3
COUNTY	663,921	125.7	592,790	112.3	32	2,046,288	64	100	0
DESERT HOT SPRINGS	145,338	27.5	123,311	23.4	7	607,950	62	99	0
INDIAN WELLS	47,374	9.0	35,008	6.6	2	290,915	57	99	32
INDIO	300,731	57.0	262,366	49.7	14	1,559,437	56	96	6
LA QUINTA	164,253	31.1	137,851	26.1	8	936,901	56	95	25
PALM DESERT	200,985	38.1	174,560	33.1	10	1,263,794	55	100	7
PALM SPRINGS	163,547	31.0	152,619	28.9	8	975,442	39	88	0
RANCHO MIRAGE	150,035	28.4	123,664	23.4	7	869,738	61	96	8
CVAG	2,102,371	398.2	1,830,506	346.7	100	9,832,899	56		

The total miles shown under the Agency Length (mi) is greater than 346.7 miles as all streets with joint ownership are assigned to both agencies, with the width adjusted accordingly. Thus, if two cities jointly own 1 mile of roadway, the 1 mile is included in each jurisdictions agency length, however the area is for the portion owned by each.

The Pavement Condition Index (PCI) presented for each agency is the weighted average by area for all roadways within each agency. Figure 4 presents the apportioned centerline length for each agency in miles. When compared to figure 1, the variance between ownership value and length become quite apparent. For example the County owns approximately 32% of the roadway network, yet only 23% of its estimated value – the reason for the difference is the County owned roadways tend to be narrower than the urban ones.

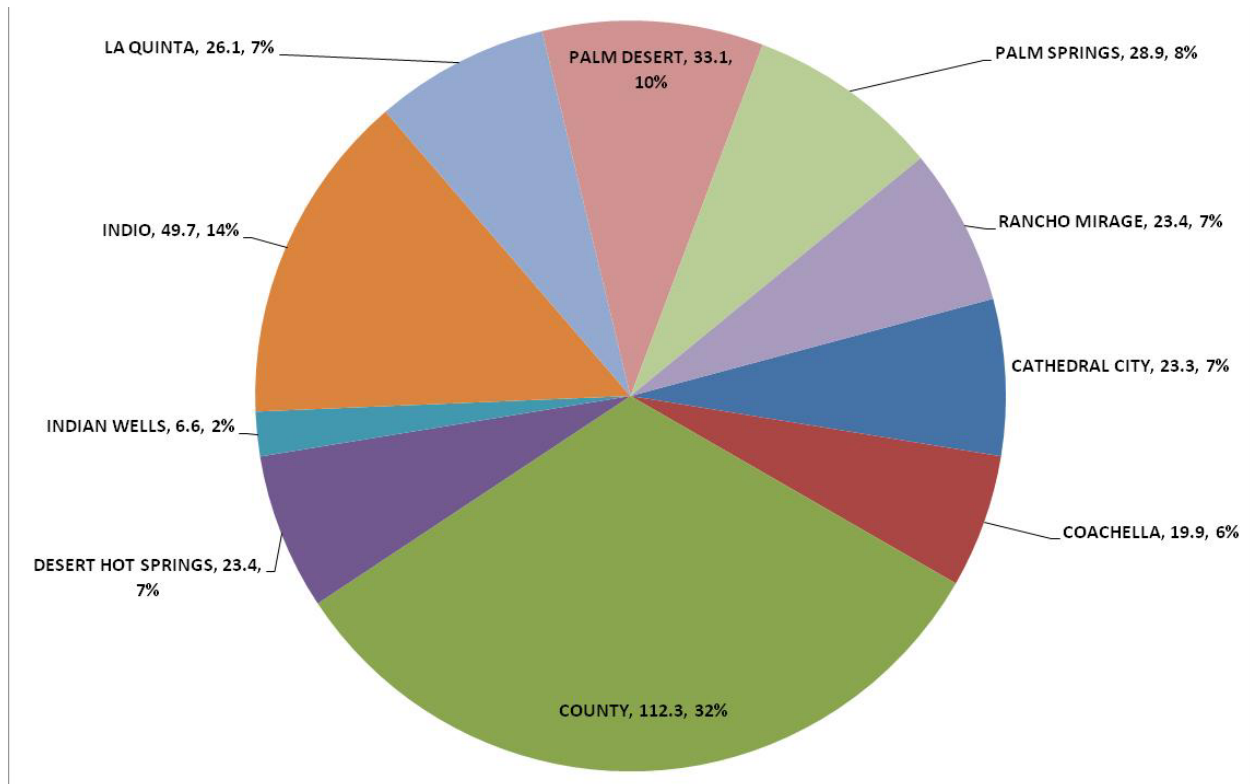

Figure 4 – Network Split by Agency (apportioned centerline miles, %)

2.2 NETWORK PRESENT CONDITION

Figure 5, presented below, shows the distribution of pavement condition for the paved roadway network in CVAG on a 0 to 100 scale, 0 being worst and 100 being best condition. The average PCI for the network is 56 – which places CVAG slightly below the average of agencies surveyed by IMS. In addition to the low PCI score, the roadway network displays atypical pavement condition characteristics when compared to other agencies in that the PCI distribution forms a near-perfect bell shaped curve, while most agencies display a slight skew to the right.

From the PCI distribution several broad generalizations may be made:

- The agency has many like new streets in good condition as evidenced by the percentage of roads with a PCI greater than 70.
- The majority of streets fall into the overlay based rehabilitation categories (40 – 70) - this is reflective of streets that have had deferred routine maintenance and are showing considerable cracks and surface distresses.
- Less than one quarter of the network requires a heavy overlay – these are the streets that need to be addressed before they deteriorate into full reconstruction candidates.
- Only a small percentage require total reconstruction.

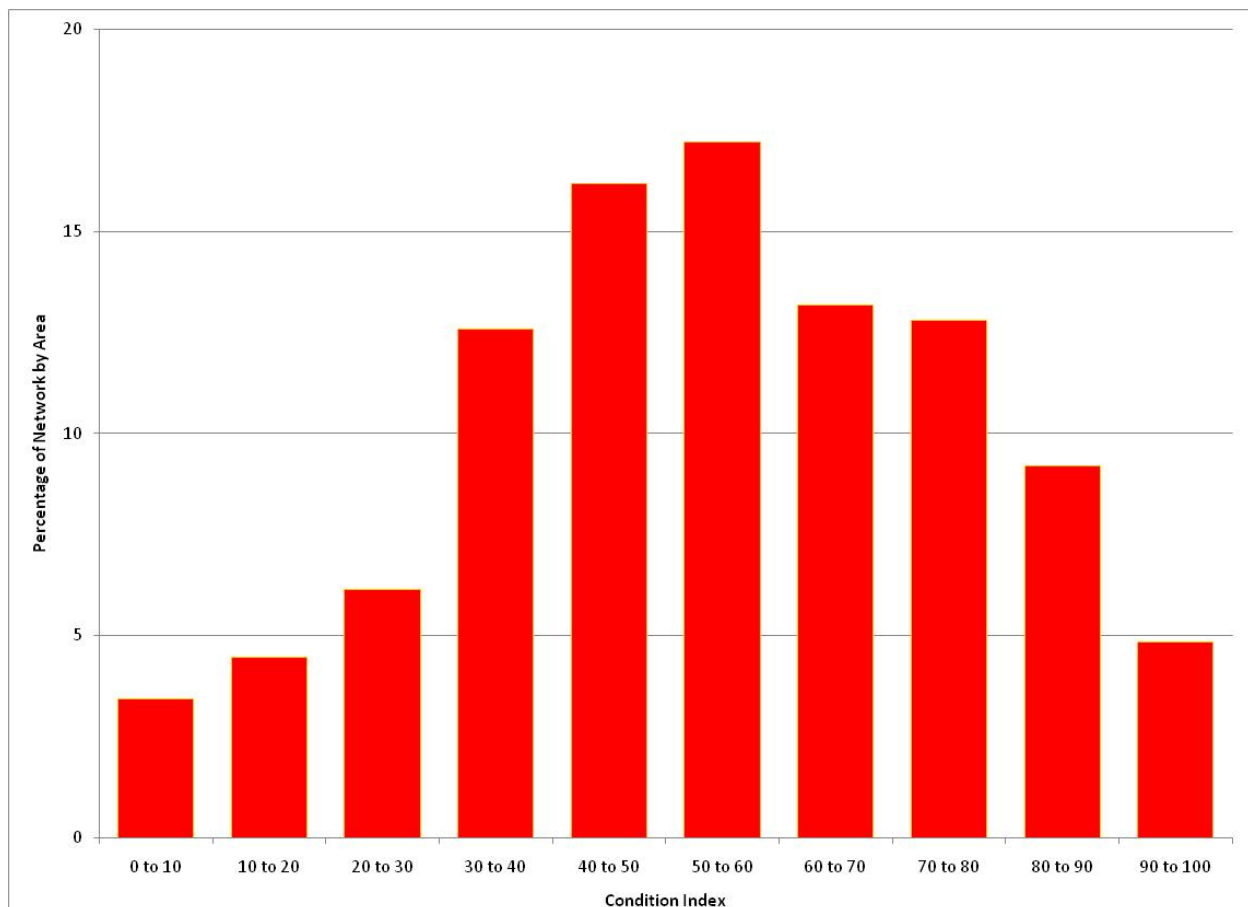

Figure 5 –Roadway Network Present Status

The following graph (Figure 6) plots the same pavement condition information, but instead of using the PCI value, descriptive terms are used to classify the roadways. From the chart, 8% of the network can be considered in excellent condition with a PCI score greater than 85. These roads are in like new condition and only require routine maintenance. Nationwide, the amount of roadways falling into the very good category is about 15%, so this value is lower than average. Eighteen percent (18%) of the network falls into the very good classification. These are roads that benefit the most from preventative maintenance techniques such as microsurfacing, slurry seals and localized repairs. These streets should be rehabilitated in a timely fashion in order to prevent more costly rehabilitation being required.

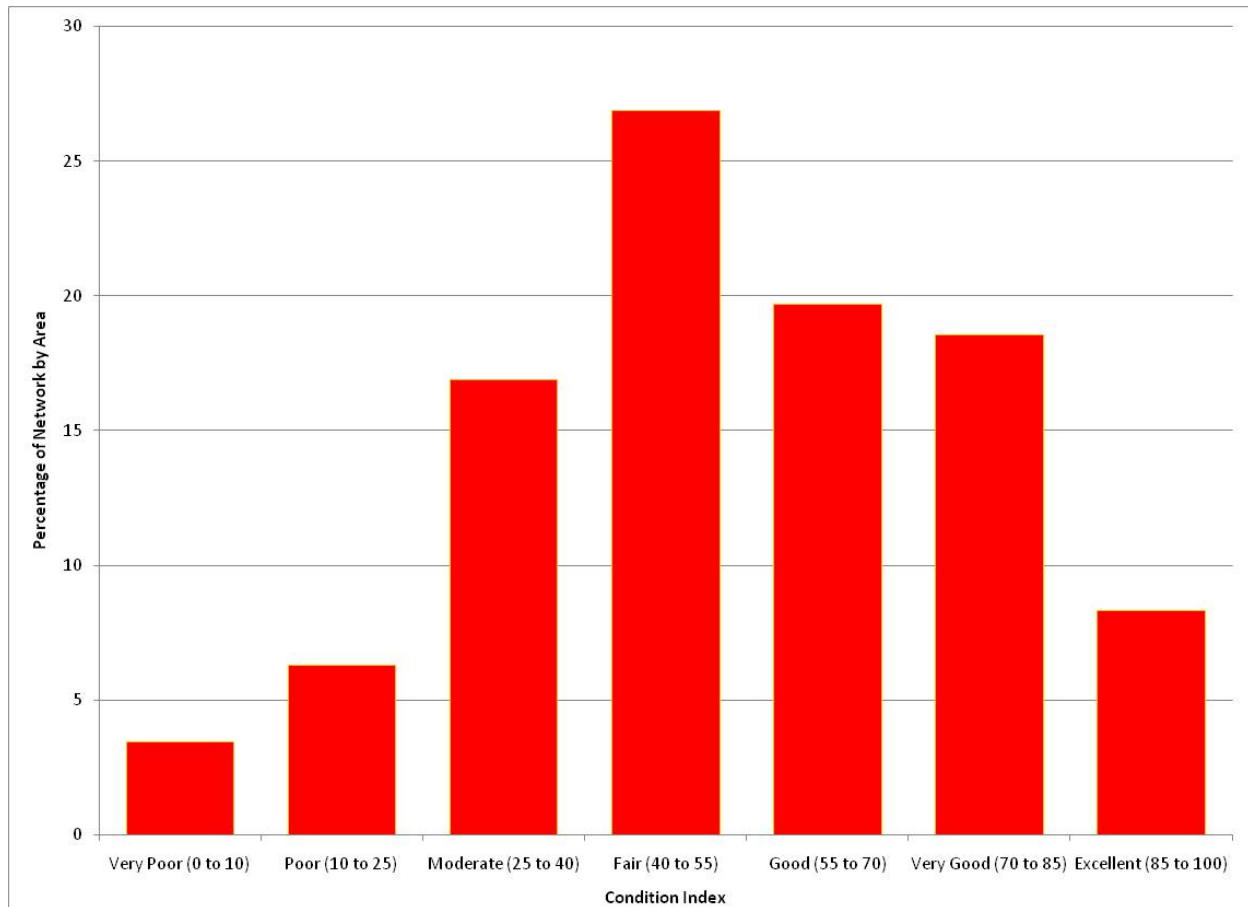

Figure 6 – Present Status Using Descriptive Terms

Forty-seven percent (47%) of the network can be considered in fair to good condition, representing candidates for thin to moderate overlay rehabilitation. If left untreated, they will decline rapidly into thick overlay or reconstruction candidates. Twenty three percent (23%) of the roads are rated as poor or moderate and are candidates for progressively thicker overlays or partial reconstruction. The remaining 3% percent of the network is rated as very poor, meaning these roadways have failed or are past their optimal due point for overlay based rehabilitation. Roadways falling progressively below the poor classification (PCI less than 25), should be considered the City's "backlog" of immediate work to do. These are the roadways that require rehabilitation efforts, in thicker depths, or reconstruction.

3.0 REHABILITATION PLAN AND BUDGET DEVELOPMENT

3.1 KEY ANALYSIS SET POINTS

The MicroPaver software application was used for the reporting and analysis with the following operating parameters implemented:

M & R Activities and Costs – the following maintenance and rehab activities were used:

Localized Activities			
Code	Name	Amount	Work Unit
JS-SI	Joint Seal - Silicon	\$3.50	Ft
PA-AD	Patching - AC Deep	\$7.00	SqFt
PA-AL	Patching - AC Leveling	\$1.25	SqFt
PA-AS	Patching - AC Shallow	\$3.25	SqFt
PA-PF	Patching - PCC Full Depth	\$25.00	SqFt
CS-PC	Crack Sealing - PCC	\$2.50	Ft
CS-AC	Crack Sealing - AC	\$2.50	Ft

Global Activities			
Code	Name	Amount	Work Unit
OL-AT	Overlay - AC Thin (Global)	\$1.61	SqFt
ST-SS	Surface Treatment - Slurry Seal	\$0.50	SqFt

Major Activities			
Code	Name	Amount	Work Unit
CM-OL-2	2 in Cold Mill & Overlay	\$2.35	SqFt
OL_2	2 in overlay	\$2.10	SqFt
CR-AC	Complete Reconstruction - AC	\$7.25	SqFt
NC-AC	New Construction - AC	\$8.35	SqFt

Analysis Assumptions – the following assumptions were used:

- Analysis period extended 5 years from 2010 through to 2015.
- Inflation, budget increases and network growth were all set to 0.
- Agencies will perform Stop Gap/Critical activities independent of the pavement management program.

Performance Curves - The following performance curve was used to establish the last rehab date and for predictive modeling.

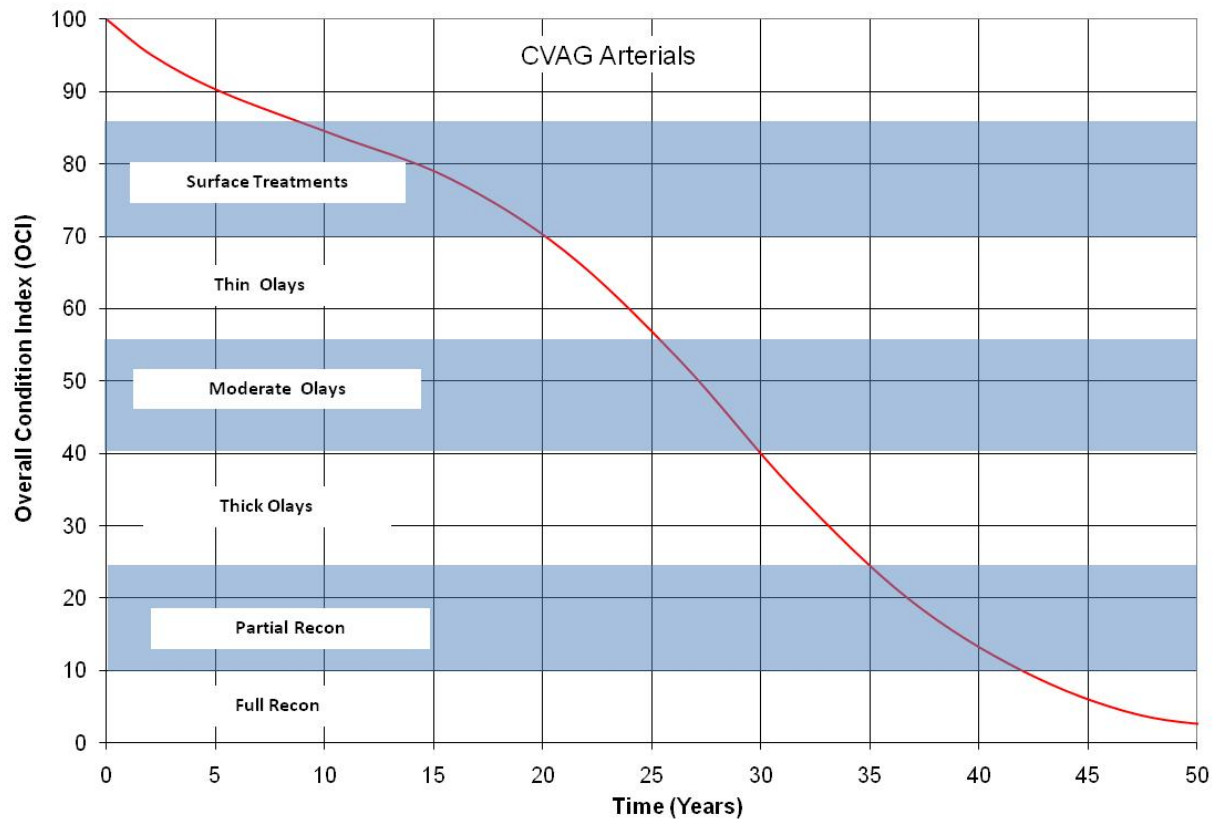

Figure 7 - CVAG Performance Curves

3.2 FIX ALL ESTIMATE

Independent of the MicroPaver program, the theoretical value to rehabilitate all streets in the network – that is remove all defects, according to their current need may be calculated by applying a range of rehab options and unit rates against the current street PCI. For CVAG, the current network deficiency is \$156M broken down as follows:

Activity	Fix All Estimate (\$)	%
Reconstruction	16,295,000	10
Partial to Full Recon	20,246,000	13
Thick Overlays to Partial Recon	36,033,000	23
Moderate Overlays	43,907,000	28
Thin Overlays	30,797,000	20
Surface Treatments	7,739,000	5
Routine Maintenance	985,000	1
Total:	156,002,000	100

The main functions of examining the Fix All Estimate is to identify the upper ceiling of rehabilitation costs the network may require in the unlimited funding budget scenario, in addition to being used as a quality control check against the analysis using the MicroPaver application. For example, the fix all total for CVAG is estimated at \$156M and annual amount to maintain the PCI at 55 is estimated at \$9.6M per year (as discussed in Section 3.3). Dividing the \$157M by \$9.6M/year yields an approximate 16.3 year rehabilitation cycle which is deemed reasonable and within acceptable limits. If the steady state analysis using the pavement management system resulted in annual budget of \$20M, this would result in an 8 year rehab cycle ($\$157M / \$20M = 8 \text{ years}$), which would then raise concerns as it is far too short and outside acceptable norms.

The CVAG Fix All Estimate rehabilitation activities compares to tradition values as follows:

Activity	Fix All (\$)	%	Typical Range
Reconstructs	36,541,000	23	25 - 50
Progressively Thicker Overlays	79,940,000	51	50 - 75
Thin Overlays	30,797,000	20	15 - 30
Surface Treatments & Routine Mainatenance	8,724,000	6	5 - 15
Totals:	156,002,000	100	

3.3 RULE OF THUMB ESTIMATES FOR MAINTAINING PCI = 55

Two methodologies exist for estimating the annual cost to maintain the network PCI at 55. Both methods are completed external to the software and are simply used to develop a better understanding of the needs of the system and as a quick check of the MicroPaver based analysis results.

- Method #1 – Network Averaging: Under this method the selected rehabilitation is based on the network average PCI and a mid range life cycle and unit rate applied. For CVAG, the average annual cost to maintain the current PCI is estimated as follows:

Network Average PCI	55
Required Rehab Based on Average PCI	Moderate Overlay
Moderate Overlay Rehab Unit Rate (\$/yd ²)	17.5
Average Life Cycle for a Moderate Overlay	15 to 20 years
Percentage of Network That Can Be Completed Each Year (%)	5.7
Total Network Area (yd ²)	9,830,000
Rehab Accomplishment Each Year (yd ²)	562,000
Estimated Annual Cost (\$/yr):	9,835,000

The results of the network averaging provide only a ballpark estimate (+ / - \$1M at best) as it assumes all streets perform in a similar fashion and treats all streets the same.

- Method #2 – Fix All Life Cycle Analysis: Under this option, the Fix All Estimate developed in Section 3.2 for each street segment is divided by the expected life cycle for the applied rehabilitation and the entire network summed up. For example, the Fix All Estimate for Thin Overlays is estimated at \$30.8M and have an anticipated life cycle of 15 years. Thus the total

contribution to the steady state budget would be \$30.8M divided by 15 years which is equal to \$2.05M annually.

The cost to maintain the current PCI of 55 is estimated \$10.7M annually. The following table uses the Fix All Estimates developed in Section 3.2 and divides them by the estimated life cycle of the applied rehabilitation to develop the \$10.7M annual total.

Activity	Fix All Estimate (\$)	Life Cycle (Years)	Fix All Life Cycle Contribution (\$/yr)
Reconstruction	16,295,000	35	465,500
Partial to Full Recon	20,246,000	25	809,900
Thick Overlays to Partial Recon	36,033,000	17	2,119,800
Moderate Overlays	43,907,000	16	2,745,000
Thin Overlays	30,797,000	15	2,053,600
Surface Treatments	7,739,000	5	1,547,800
Routine Maintenance	985,000	1	985,000
Total:	156,002,000		10,726,600

From these two estimates, the cost to maintain the PCI at 55 may be estimated to be on the order of \$9.0M to \$11.0M annually.

3.4 NETWORK BUDGET ANALYSIS MODELS

A total of 5 budget runs scenarios were investigated as part of the CVAG analysis. The 5 scenarios are:

- Unlimited budget –similar to the Fix All Estimate assessment, the unlimited budget assumes unlimited funding over 5 years and takes into account network deterioration and allows repeat rehabilitations to occur. The Unlimited budget will never raise the PCI to a perfect 100 as it is mathematically impossible since streets are only rehabbed when needed, usually starting at a PCI of 85 (meaning streets are allowed to deteriorate from 100 to 85 before rehabilitation occurs, thus the average can never be 100).. Also not all rehabs result in a perfect 100. What the unlimited budget does is rehab each street as it becomes a need and identifies the theoretical maximum value CVAG would ever spend. It is always on the same order of magnitude as the Fix All Estimate but never equal.

The unlimited funding budget is approximately \$27.8M/year or a 5 year total of \$139M and raises the PCI to a peak of 90 and then deteriorates to an 86 over the next 4 years as street segments wait for their next rehabilitation.

- Do Nothing option – this analysis run highlights the detrimental effect of spending no capital funding on the roadway network. The network PCI would drop from current value of 55 to 43 at the end of 5 years. The Do Nothing option is run in order to identify equity being removed from the system due to deferring of rehabilitation activities.
- Steady State – identify the costs to maintain the existing network PCI at about a 55. Over the course of 5 years, an annual budget of \$9.6M/yr is required to maintain the network average PCI at 55.

- 50% of Steady State funding – decrease the funding to 50% of the steady State requirement and identify the resultant network PCI.
- 150% Steady State Funding – increase the funding to 150% of the steady state cost and identify the resultant network PCI.

The results of the analysis are summarized in the following plot (Figure 8):

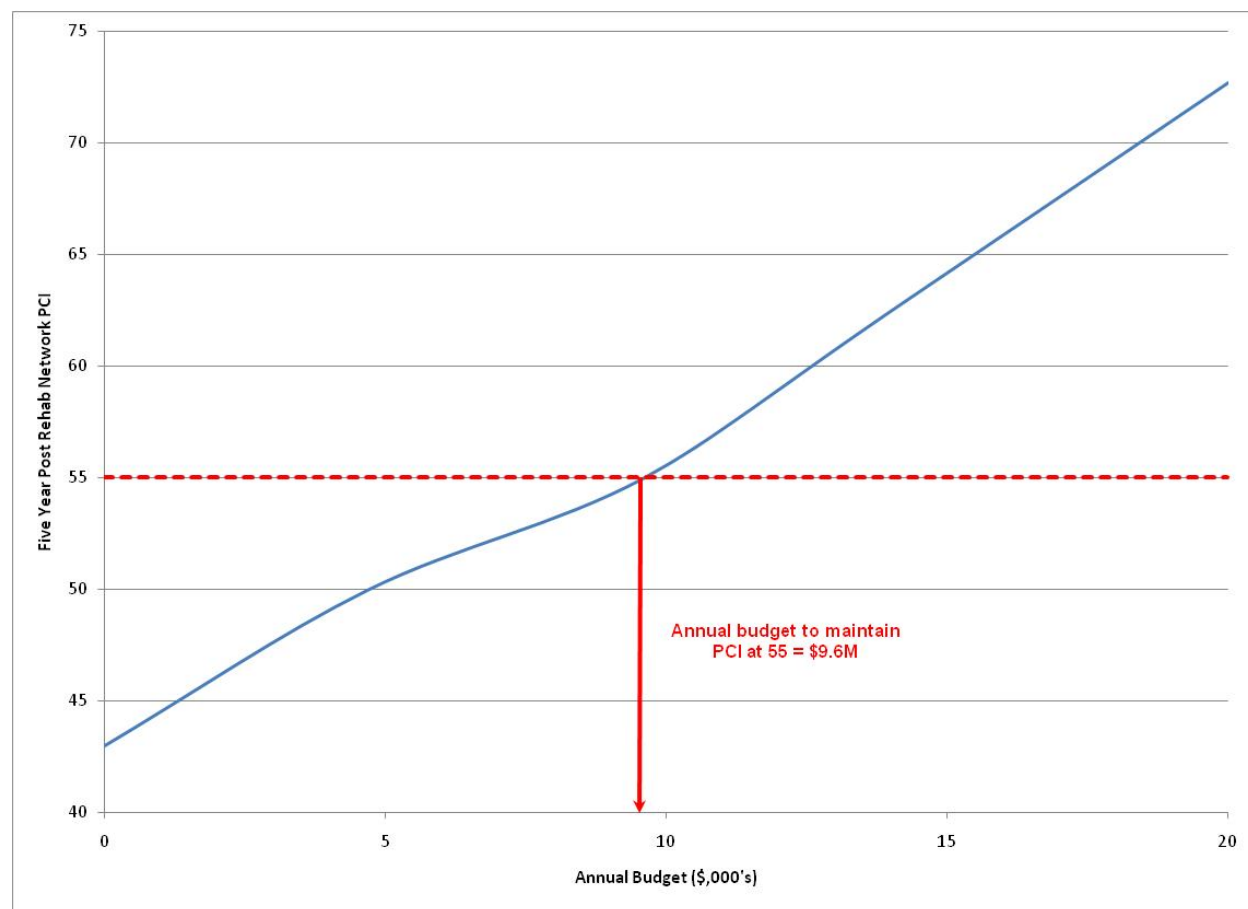

Figure 8 –5 Year Network PCI Analysis Results

The X axis highlights the annual budget, while the Y axis plots the 5 year–post rehab network average PCI value. The diagonal blue line is the resultant network PCI value for any given annual budget (the same amount spent each year for 5 years). The plot may be used to interpolate between analysis runs amounts to fine tune budgets and desired level of service targets. For example, to maintain the 2009 PCI of 55, an annual budget of approximately \$9.6M would be required. To target PCI's of 60 or 65, budgets of \$12.5M and \$15.5M annually would be required. Also, Figure 8 provides a quick reference to the “what if” question of what would happen to the network if the budgets were raised or lowered by a fixed amount without having to re-run the models.

Please note, Figure 8 is plotting the network average PCI after 5 years of rehab have been completed against annual budget amounts. Figure 8 does not provide a year by year trace of the network PCI (that is contained in Figure 9). All plots use a PCI starting point of 55 as measured in 2010.

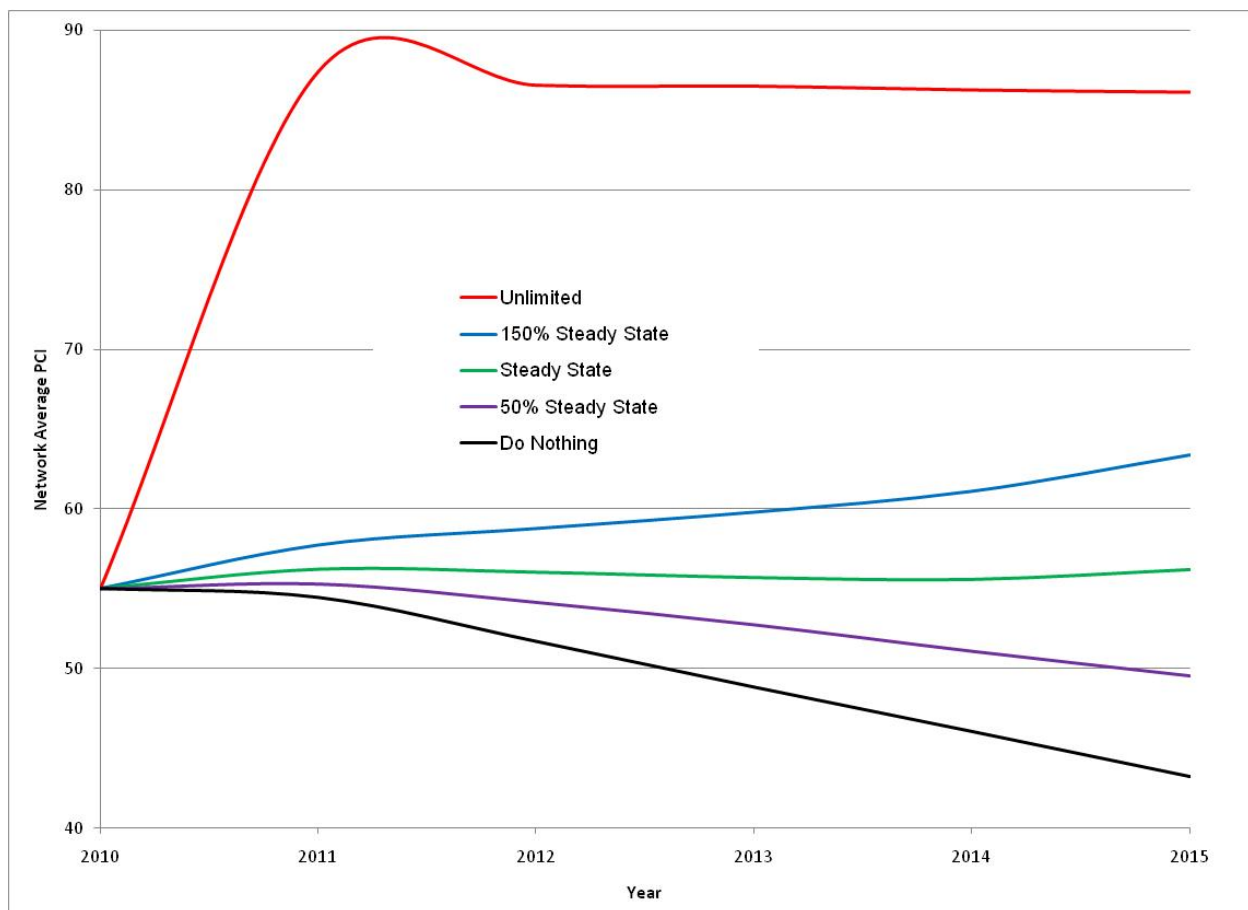

Figure 9 – Network Annual PCI Analysis Results

Figure 9 presents the same analysis results on an annual basis. In this plot, the X Axis is now the analysis year, and the Y axis the network average PCI for each year of the analysis. The plot lines are the year by year network average PCI.

The Unlimited budget contains a large jump in PCI followed by a gradual decline. This is how an unlimited budget is supposed to look. In year one, it rehabilitates every street that is a need – essentially it fixes all streets below a PCI of 85. In the subsequent years, it rehabs only those streets that drop below an 85.

By examining the differences between the various budgets and PCI results, the benefits of maintaining the system at its current level of service may be compared against letting the system deteriorate and then attempting to rebuild it (essentially the cost of the Do Nothing option in terms of returning the system back to its original PCI). The amount of cost savings for CVAG may be estimated at:

1. The Unlimited budget raises the OCI from 55 to an 86 and costs approximately \$139M or \$4.5M per point increase (55 = starting PCI, 86 = Final PCI, $\$139\text{M} / (86-55) = \4.5M per PCI point raised).
2. The \$9.6M annual budget maintains the PCI at 55 and invests approximately \$48M over 5 years.
3. The do nothing drops the PCI from 55 to a 43 for a 12 point PCI drop. At \$4.5M per point (as developed in item 1. above) this equates to \$54M being required to return the system to a PCI of 55. $(55-43) \times \$4.5/\text{pt} = \54M
4. The cost to maintain the system on an annual basis is therefore \$6M dollars less than letting it deteriorate and then attempting to rebuild the network ($\$54\text{M} - \$48\text{M} = \$6\text{M}$).

3.5 NETWORK RECOMMENDATIONS AND COMMENTS

The following recommendations are presented to CVAG as an output from the pavement analysis, and must be read in conjunction with the attached reports.

1. CVAG should adopt a policy statement identifying the desired level of service and acceptable amount of backlog. We suggest a course to maintain the existing PCI:

An annual budget of \$9.6M is required to achieve this goal over 5 years

The MicroPaver outputs for the Steady State budget option are presented in Appendix C of this report.

2. The CVAG should continue a proactive approach to pavement management, focusing on early intervention and maintaining their existing investments in pavements. This would allow the CVAG to maintain the quality of their system with no increase in backlog.
3. The full suite of proposed rehabilitation strategies should be reviewed prior to finalization of these budgets as they can have a large effect on the analysis.
4. Compliance with the Americans with Disabilities Act is required on all roadway rehabilitation projects including: the provision of para-ramps at all crosswalks, minimum of 30 inch obstruction free clearance along all sidewalks, and a maximum of 1 inch lip of asphalt above the curb line.
